To Whom It May Concern

The Vita Group statement in relation to our PU foams used in Skin Contact

The Vita Group manufactures certified and tested PU Foam grades for direct skin contact, which are approved by external test houses and accredited laboratories.

The Vita Group has a number of foam grades that are approved for skin contact applications are available for immediate supply. Over the coming weeks, we are determining which other grades can be used in these applications as we react to the growing demand and set up testing with the accredited laboratories.

At present Vita is receiving a large number of enquiries for flame retardant grade foams (Combustion Modified Ether Range) from its UK & international customer base. Currently our flame retardant grades are not approved for skin contact applications. As there has previously been no requests on testing for skin contact.

As part of our duty of care to our customers and the end users, we will always endeavour to ensure that you are provided with the correct and accredited type of foam and the relevant health and safety information for the application and use.

The Vita Group has 14 foaming plants across Europe where we can provide alternative grades in volume; in block, sheet or finished components. and are available for supply in the UK. We are working to increase availability of these grades across our manufacturing and conversion networks.

Please contact your local account manager who can assist you in selecting the correct grades for your application.

Your sincerely

A handwritten signature in blue ink, consisting of a series of loops and a long horizontal stroke, followed by a vertical line that crosses the horizontal stroke.
